

Credence

Controlling water quality and farm biosecurity

Rapid kill rate of harmful bacteria and pathogens with less corrosion
Increased water uptake for improved production

Manufactured for and distributed by:

Credence

Credence – controlling water quality and farm biosecurity

What is Credence?

A slow release stable form of Chloride ions presented in a unique tablet form.

Credence is long lasting in open and enclosed water systems with a rapid kill rate (5- 10 minutes).

Credence does not expose you to the high-density Chlorine smell or taste when used as per label instructions.

Credence is less corrosive in pipework etc compared to other disinfectants even while demonstrating unparallel persistence over time, 100% strength after 30 days.

So easy and safe to use (Credence is used by the World Health Organisation – WHO)

Credence is the ideal solution for treating stock and household drinking water, cleaning livestock housing, sheds and facilities including feeding equipment. The Credence tablet is simply added to stock dams, water troughs and directly into water holding tanks.

Dilution rates

Disinfecting rate: 1 Credence tablet to 15 lts of water, spray and leave to air dry

Water troughs, household and shed tanks: 1 Credence tablet per 1000 lts of water

Dams: 1 Credence tablet per 1000 lts of water. To measure, each cubic meter stepped out = 1000 lts

Visit www.ahdltd.co.nz for Credence support material including New Zealand trial work.
